

Windowmaker Option

Open Modules for Fittings and Fabrication Labour

Overview

A facility to set-up Fittings and Labour modules. This option is only applicable to Windowmaker Lite.

Windowmaker Lite is the entry level product for the Windowmaker product range - ideal for use by the small fabricators. The Windowmaker data for this comes either from the Windowmaker supplier or profile supplier. For the fabricator the technical data is 'closed' and he cannot make any changes to it.

Upgrading Windowmaker Lite to include the [Costing/Pricing](#) option allows the fabricator to just change the costs of the components, and hence calculate the correct costing/pricing for the window/door products.

The 'Open Fittings and Labour modules' option completely opens up the said modules for customisation.

Benefits

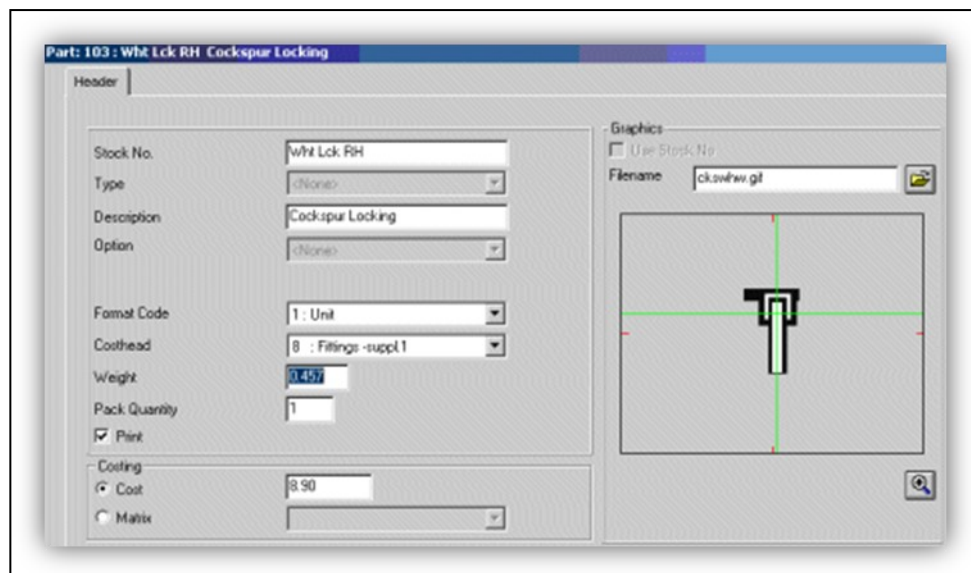

The fabricator can:

- ▶ Set-up and maintain the fittings and labour details himself, and is thus in full control of these
- ▶ Increase his productivity by generating the B.O.M. with the details of fittings and labour

Features

Upgrading to this option enables setting up data in Fittings Data and Labour modules. These data includes:

- ▶ Parts - including Graphical images of individual parts (e.g. handles, hinges) that can be displayed on Sales Line graphics
- ▶ Parts Matrices - to select the correct part based on conditions
- ▶ Subsystems - to write rules to dynamically control the options and answers available and to calculate the correct Fittings and Labour B.O.M.
- ▶ Costs and Cost Matrices - to calculate costing/pricing of a window/door (If also upgraded to [Costing/Pricing](#) option)
